

Component Lifecycle & Hooks

Pemrograman Web (IF201)

Fundamental Web & React

Hooks

Hooks memungkinkan penggunaan state dan lifecycle di function component. Diperkenalkan di React 16.8.

useState

```
const [count, setCount] = useState(0);
const [name, setName] = useState('');
```

useEffect — Side Effects

```
useEffect(() => {
  let cancelled = false;
  fetch(`/api/users/${userId}/posts`)
    .then(r => r.json())
    .then(data => { if (!cancelled) setPosts(data); });
  return () => { cancelled = true; };
}, [userId]);
```

Dependency Array

Pattern	Perilaku
useEffect(fn)	Setiap render

useEffect(fn, [])

Sekali saat mount

useEffect(fn, [dep])

Saat dep berubah

Custom Hooks

```
function useLocalStorage(key, initial) {
  const [val, setVal] = useState(() => {
    const s = localStorage.getItem(key);
    return s ? JSON.parse(s) : initial;
  });
  useEffect(() => {
    localStorage.setItem(key, JSON.stringify(val));
  }, [key, val]);
  return [val, setVal];
}
```

Ringkasan

useState untuk state, useEffect untuk side effects, useRef untuk mutable references. Selalu perhatikan dependency array.
